1. Introduction

In the last section of previous paper, I wrote

\[ \langle t' | t \rangle = \langle t | t' \rangle = \langle t | t' \rangle = 0. \]  \hspace{1cm} (1)

This expression is verified by rewriting this in the matrix form.”

The purpose of this paper is to give the proof of this expression (1).
In section 2 the matrix representation of field operators is given. In the final section
a speculation about the implication of expression (1) is given.

2. The orthogonal relation of state vectors

We define the extended ket vector \(|v_k\rangle\) with its components \(v_k\) as a column
vector. That is

\[ |v_k\rangle = \begin{pmatrix} 
\vdots \\
v_{-2} \\
v_{-1} \\
v_0 \\
v_{+0} \\
v_1 \\
v_2 \\
\vdots 
\end{pmatrix}, \]

where the line \(\longrightarrow\) inside the parenthesis is the center line.

There are two center components \(v_{\pm 0}\) on both sides of the center line and the number
of components of this ket vector is even, although it is infinite. The componets
of this vector extend both upward and downward limitlessly.
The corresponding bra vector \(\langle v_k|\) is defined by

\[ \langle v_k| = \begin{pmatrix} 
\vdots \\
v_{-2} & v_{-1} & v_0 & v_{+0} \\
v_1 \\
v_2 \\
\vdots 
\end{pmatrix}, \]

where the line \(\langle\rangle\) inside the parenthesis is also the center line.

Thus, for example, the scalar product of \(|u_j\rangle\) and \(|v_k\rangle\) is written as

\[ \langle u_j|v_k\rangle = \sum_{k=-\infty}^{\infty} \delta_{jk} u_j v_k = \sum_{j=-\infty}^{\infty} u_j v_j = \langle v_k|u_j\rangle, \]
where we must take $j, k = \mp 0$ into account.  
The state vectors and the field operators are defined for two cases. (We express these confining themselves for the case of one degree of freedom. The generalization to the arbitrary degrees of freedom is obvious.)

1) The operators of boson  

The $n$-particle state of boson $|n>, (|n'>')$ in Fock space (in counter Fock space) is as follows.

$$
|n> = 
\begin{pmatrix}
0 \\
0 \\
\vdots \\
0 \\
0 \\
1 \\
0 \\
\vdots \\
\vdots \\
\vdots \\
\vdots \\
0
\end{pmatrix}, 
|n'> = 
\begin{pmatrix}
0 \\
1 \\
\vdots \\
0 \\
0 \\
0 \\
\vdots \\
\vdots \\
\vdots \\
\vdots \\
0
\end{pmatrix}
$$

where

$$
v_j = \begin{cases} 
0 & (i f j \leq -0) \\
\delta_{jn} & (i f j \geq +0)
\end{cases}, 
v_{j'} = \begin{cases} 
\delta_{j'-n'} & (i f j' \leq -0) \\
0 & (i f j' \geq +0)
\end{cases}
$$

respectively, and $\delta_{ab}$ is Kronecker’s delta.  

Then we define the number operator $N(N')$ in Fock space (in counter Fock space) by

$$
N|n> = a^\dagger a|n> = n|n>, \quad N'|n'> = a a^\dagger |n'> = n'|n'>'.
$$

That is,

$$
a|n> = \sqrt{n}|n-1>, \quad a^\dagger |n> = \sqrt{n+1}|n+1>,
$$

and

$$
a^\dagger |n'> = \sqrt{n'}|n'-1>', \quad a|n'> = \sqrt{n'+1}|n'+1>.'
$$

Hence, $a|0> = 0, \quad a^\dagger |0> = 0$.  

Thus we can get immediately

$$
<n'|n> = <n'|n> = <n|n'> = 0.
$$

From this expression it follows straightforwardly

$$
<t'|t> = <t|t> = 0.
$$
However before we conclude this, we must define the field operators explicitly to establish the formalism completely.

To begin with we define the quadrants of an extended matrix $M$, in such a way that they are represented as the following expression.

That is,

$$
M = \begin{pmatrix}
\text{The third quadrant} & \text{The second quadrant} \\
\text{The forth quadrant} & \text{The first quadrant}
\end{pmatrix}.
$$

The destruction (the creation) operator $a$ ($a^\dagger$) of boson is represented by

$$
a = \begin{pmatrix}
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
\vdots & 0 & \sqrt{3} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & \sqrt{2} & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & \sqrt{2} & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \sqrt{3} & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots
\end{pmatrix},
$$

$$
a^\dagger = \begin{pmatrix}
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
\vdots & \sqrt{3} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & \sqrt{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & \sqrt{2} & 0 & 0 & 0 & \vdots \\
\vdots & 0 & 0 & 0 & 0 & 0 & 0 & \sqrt{3} & 0 & 0 & \vdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots
\end{pmatrix}.
$$
Thus,

\[
[a, a^\dagger]_\equiv = \begin{pmatrix}
\ddots & \ddots & \ddots \\
& -1 & -1 & -1 \\
& & -1 & +1 & +1 \\
& & & +1 & +1 \\
& & & & \ddots \\
\end{pmatrix},
\]

(All the elements in the second and the fourth quadrant of this matrix are zeros, and the off-diagonal elements in the first and the third quadrant of this matrix are all zeros.) where, \([a, a^\dagger]_\equiv = aa^\dagger - a^\dagger a\), and we have (2), (3), (4).

2) The operators of fermion
In this case the state vectors \(|0\rangle, |0\rangle'\) or \(|1\rangle, |1\rangle'\) whose occupation number is zero or one are represented by

\[
|0\rangle = \begin{pmatrix}
0 \\
0 \\
1 \\
0
\end{pmatrix}, \quad |0\rangle' = \begin{pmatrix}
0 \\
1 \\
0 \\
0
\end{pmatrix},
\]

or

\[
|1\rangle = \begin{pmatrix}
0 \\
0 \\
0 \\
1
\end{pmatrix}, \quad |1\rangle' = \begin{pmatrix}
1 \\
0 \\
0 \\
0
\end{pmatrix},
\]

respectively.  
The destruction and the creation operators \(b\) and \(b^\dagger\) for the state vectors \(|0\rangle\) and \(|1\rangle\) are

\[
b = \begin{pmatrix}
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 \\
0 & 0 & 0 & 0
\end{pmatrix}, \quad b^\dagger = \begin{pmatrix}
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 1 & 0
\end{pmatrix},
\]

respectively. These operators are also the creation and the destruction operators for the state vectors \(|0\rangle'\) and \(|1\rangle'\) respectively.
Hence,

\[ [b, b^\dagger]_+ \equiv bb^\dagger + b^\dagger b = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \equiv \begin{pmatrix} I \\ 0 \\ 0 \\ I \end{pmatrix} \equiv I, \]

and,

\[ b^2 = 0, \quad b^{2^2} = 0; \]
\[ [b, b]_+ \equiv bb + bb = 0, \quad [b^\dagger, b^\dagger]_+ \equiv b^\dagger b^\dagger + b^\dagger b^\dagger = 0; \]
\[ b|1 \rangle = |0 \rangle, \quad b|0 \rangle = 0, \quad b|0 \rangle' = |1 \rangle', \quad b|1 \rangle' = 0; \]
\[ b^\dagger|1 \rangle' = |0 \rangle', \quad b^\dagger|0 \rangle' = 0, \quad b^\dagger|0 \rangle = |1 \rangle, \quad b^\dagger|1 \rangle = 0. \]

Thus the expression (6) was proved explicitly.

3. Discussion

We interpret about the implication of the expression (6) that it means that the positive (the negative) energy particle does not interacts with any negative (positive) energy particle through the electro-magnetic and any other kinds of interaction except for the gravitational interaction. Thus we may speculate that we can identify the negative energy which belongs to the counter Fock space to the dark energy.

In this paper I would like to present and propose the following three items.
1. The extended matrix as the expression to represent field operators.
2. Fock space and counter Fock space are orthogonal to each other.
3. A speculation that the particles with the negative energy which belong to the counter Fock space are identified to the substances with the dark energy.
